

J2EE Programming using RAD7

CDT740

This course makes extensive use of hands-on examples and exercises to familiarize the student with servlet and JSP programming. While the emphasis of this course is on the programming of servlets and JSPs, participants will also gain expertise in working with many of the features of IBM's Rational Application Developer V7: features which make it the platform of choice for servlet development. Participants will develop systems in which web pages, servlets, and JSPs work together consistent with the Model 2 Architecture.

Audience

- Java programmers who want to increase their knowledge of the Java language
- Java programmers who will be building enterprise applications using J2EE

Prerequisites

- Prior programming experience or training in Java Programming using RAD7 is required
- Prior programming experience or training in [HTML](#) and/or [JavaScript](#) is recommended but not required

Course Length

- Five days

Teaching Methods

- Lecture
- Hands-on examples
- Supplemental hands-on exercises

Learning Objectives

- understand the servlet life cycle
- develop and test servlets using RAD7
- know how and when to use the init(), doGet(), doPost(), and destroy() methods
- create HTML/XHTML web pages, especially forms and input controls
- retrieve information from HTML/XHTML forms
- use cookies and session tracking to persist objects
- use JDBC to access relational databases from a servlet
- write servlets for record input, query, and deletion
- understand the JSP life cycle
- develop and test JSPs using RAD7
- create JSPs which use data retrieved from HTML/XHTML forms
- create JSPs which use JavaBeans passed from other servlets
- create JSPs which use JDBC to access relational databases
- write JSPs which work alone and in conjunction with other servlets
- develop systems in which web pages, servlets, and JSPs work together consistent with the Model 2 Architecture

Course Outline

QF4

Knowing the players

- WAS vs RAD7
- Creating a test server

Life Cycle of a Servlet

- Creating a Web Application
- init()
- doGet()
- doPost()
- destroy()

Parameters

- Creating servlet parameters
- Accessing servlet parameters
- Creating context parameters
- Accessing context parameters

Creating a web page

- Creating JSP init parameters
- HTML/XHTML with RAD 6
- Design, Source, and Preview views
- Easy web page creation with Design view
- Form
- Label
- Text field
- List box
- Radio button
- Checkbox
- Submit button
- method = "Get" vs. method = "Post"

Accessing form parameters

- getParameter()
- Detecting null input
- Data validation techniques
- Exception handling

Java Beans

- Defining entity beans
- Instantiating entity beans with form data

Object Persistence

- Data Access Object (DAO) design pattern
- Using cookies
- Using session tracking
- Using JDBC

Introduction to JSPs

- What is a JSP?
- JSPs: When and why?
- Components of a JSP

Our First JSP

- Creating a JSP
- Including an expression
- Running a JSP on the server

Scripting

- Scriptlets
- Comments, expressions, and declarations

Life Cycle of a JSP

- jspInit()
- jspDestroy()
- <body></body>

Init Parameters

- Creating JSP init parameters
- Accessing JSP init parameters
- Creating context init parameters
- Accessing context init parameters

Simple JSPs

- More scripting
- Text fields and request getParameter()

- Declaring variables
- Defining methods
- Hidden fields
- Radio buttons
- Submit button
- method = "Get" vs. method = "Post"

Implicit Objects

- Implicit objects available to the JSP programmer
- Object scope: application, page, request, session

Database Query from a JSP

- Getting the key fields from a FORM
- Accessing the database with JDBC
- Formatting and displaying the results
- <%@ page import %>
- Error processing

Error Pages

- Defining exceptions
- Defining an error page JSP
- <%@ page isErrorPage="true" %>
- throwing an Exception from a JSP
- <%@ page errorPage="MyErrorPage.jsp" %>

Model 2 Architecture: JSP/Servlet Interaction

- What is Model 2 Architecture?
- Review of JavaBeans
- Passing a bean to the JSP: request.setAttribute
- Forwarding to the JSP: RequestDispatcher.forward
- <jsp:useBean>
- <jsp:getProperty>
