

## **Introduction to MS SQL Server 2000**

### **5 days**

#### Description

This course provides an introduction to using Microsoft's Transact-SQL to retrieve and manipulate data in an MS SQL Server 2000 database. The course begins with basic relational database terms and concepts. It includes writing SQL statements for creating and altering tables and views as well as adding, changing, or deleting data in tables and views. The creation and manipulation of objects, stored procedures, and triggers is also covered. Administrative functions for MS SQL Server 2000 are not covered, except incidentally.

Hands-on exercises are used to reinforce the concepts taught and to provide experience with the syntax and structure of SQL.

#### Audience

Developers, analysts, DBAs or any others who need to use SQL statements to manipulate a MS SQL Server 2000 database.

#### Prerequisites

No previous experience with SQL or any relational database is required for this course. Students must be familiar with basic computer terms and operations, and with a Windows environment.
